Silicone Product Profile

The products introduced in this selector guide consist of RTV (Room Temperature Vulcanizing) silicone products that are commonly found in Electric and Electronic applications and component assemblies. This family of silicone products consists of both **Room Temperature Cure** and **Heat (Addition) Cure** grades.

Momentive Performance Materials offers a comprehensive portfolio of silicone solutions to help meet a broad array of handling and performance needs in electronic components and assemblies. Selection of the appropriate type of RTV depends upon the required manufacturing process, handling

requirements, curing conditions, equipment, and desired material properties.

Condensation Cure

Condensation cure silicone products cure when exposed to moisture in the environment at room temperature. These materials are categorized into Alkoxy, Acetoxy, or Oxime based on the byproducts that occur during cure.

Heat (Addition) Cure

Heat cure grades cure upon exposure to elevated heat or room temperature.

Sealing & Adhesion

Silicones are used in a wide array of applications for bonding components, and sealing against moisture or environmental contaminants. A comprehensive portfolio of 1 Part and 2 Part Adhesives and Sealants, many of which are excellent candidates for assembly applications on or near sensitive electrical and electronic components, are available. These materials are applied by a variety of methods ranging from manual dispensing to auto-dispensing units for tube, cartridge, pail, or drum packages. Mixing for 2 Part grades may be accomplished by either

manual processes or meter mix dispensing, depending on production volume and post-mix material properties.

Performance Considerations

- Temperature Resistance
- Dielectric Resistance
- Flame Retardancy
- Low Volatility
- Adhesion
- Mechanical Strength
- Hardness
- Thermal Conductivity

Process Considerations

- Viscosity
- Cure Mechanism
- Cure Temperature
- Cure Time
- Pot Life

Coating

The Coating process involves the application of silicone in a thin protective layer to a component surface by methods such as dip, flow, spray, and selective

robotic coating. Selection of a silicone coating material for a particular application involves the consideration of various performance and processing criteria.

Performance Considerations

- Temperature Resistance
- Dielectric Resistance
- Flame Retardancy
- Low Volatility

Process Considerations

- Viscosity
- Cure Mechanism
- Cure Temperature
- Cure Time
- Pot Life

Potting & Encapsulation

Silicone rubber and gels are widely used in electronics to ensure mechanical and environmental protection. A full range of products are offered in various cure speeds, viscosities, and

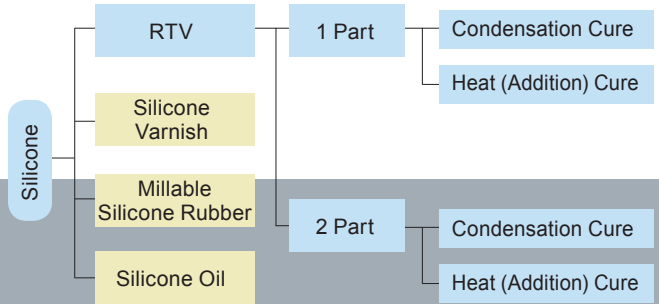

performance, many of which offer enhancements for thermal cycling protection, stress relief, material strength, flame retardancy, or optical clarity.

Performance Considerations

- Temperature Resistance
- Dielectric Resistance
- Flame Retardancy
- Low Volatility
- Adhesion
- Stress Relief
- Release Properties
- Thermal Conductivity

Process Considerations

- Viscosity
- Cure Mechanism
- Cure Temperature
- Cure Time
- Pot Life

Relative Performance Characteristics

Property	Silicone RTV	Epoxy	Urethane
Temperature Range	-50 ~ +200 °C	-50 ~ +150 °C	-30 ~ +120 °C
Heat Resistance	Good	Poor	Poor
Flame Retardancy ¹	Good	None	None
UV Stability	Good	Poor	Poor
Ozone Stability	Good	Poor	Poor
Modulus	Low	High	High

¹As a base material silicone demonstrates flame retardant properties comparable to UL94HB

Industries Served

Electronic Devices and Power Modules

Momentive Performance Materials is a driving force as a supplier of advanced silicone technology to the electronics industry. Increasing electronic component densities and performance demands have created a need for specialized silicone solutions from Momentive for a broad mix of performance and handling requirements.

Typical Applications:

- Power converters
- Inverters
- Hybrid ICs
- Micro-Electronic packaging
- High-voltage component insulation
- Membrane switches
- Photo couplers

Board Assembly

Silicones are found in board-level adhesion, coating, and encapsulation applications, and contribute to the long-term, reliable performance of many components and assemblies. A wide portfolio of products is available, providing flame retardancy, thermal conductivity, temperature resistance, low-volatility, or high-purity benefits.

Typical Applications:

- Board-level adhesion, fixing, and sealing
- PCB coating
- Component encapsulation
- Junction Coating Resins

Consumer Electronics

Silicones are commonly used in a variety of consumer electronics applications. In addition to providing adhesion to many substrates, an array of grades are available to provide heat resistance, flame retardancy, low volatility for sensitive components, and moisture protection.

Typical Applications:

- Flat panel displays
- PCs and Smart Phones
- LED Lighting
- Air conditioner units
- Control panel insulation
- PCB fixing and sealing

Automotive Electronics

The automotive industry plays a critical role in integrating new electronic technologies. As more and more components migrate to electronic solutions, silicones play an increasingly important role in helping deliver material solutions that contribute to design flexibility and long-term component reliability under harsh operating conditions.

Typical Applications:

- ECU potting, sealing, coating
- Wire connector sealing
- Sealing, encapsulation in a broad range of sensors
- HVAC system sealing
- Vibration dampening
- Headlamp assemblies

Aviation and Aerospace

Avionics and frame assembly needs in Aviation and Aerospace are served through silicone adhesives, coating, encapsulation and potting materials that help withstand stress and temperature extremes.

Typical Applications:

- Avionics
- Circuit and terminal protection
- Wire sealants
- Engine gasketing
- Cargo door, window sealing
- Weatherstrip adhesives
- Aviation lighting
- Ventilation ducts

Energy

Reliability of electronic components and the ability for panels to withstand harsh conditions over the lifecycle of the product are important considerations in solar energy applications. Momentive Performance Materials helps serve this growing industry with its range of potting materials and sealants.

Typical Applications:

- Terminal box potting
- Box and base sealing
- Aluminum frame and glass / EVA plate sealing

Application Geometry and Cure Chemistry Options

The shape and conditions of the part are important in selecting the suitable silicone grade for each application.

The following are some general guidelines:

Shallow Cavity / Small Mass

Selection Options:
- 1 Part Condensation Cure
- 1 Part Heat Cure
- 2 Part Room Temp. Cure
- 2 Part Heat Cure

Complex Design - Exposed Surface

Selection Options:
- 1 Part Heat Cure
- 2 Part Room Temp. Cure
- 2 Part Heat Cure

Deep Cavity / Large Mass

Selection Options:
- 1 Part Heat Cure
- 2 Part Room Temp. Cure
- 2 Part Heat Cure

Enclosed System

Selection Options:
- 1 Part Heat Cure
- 2 Part Heat Cure

Cure Speed:

The cure speed of 2 Part Condensation Cure grades can be changed by adjusting the amount of the catalyst component. However, the post-cure properties of the material may vary from those achieved under standard mixing ratios, and therefore adequate testing and confirmation prior to use in an application is required.

TSE3663 - Mixing Ratios & Viscosity (23°C)

Product Details - 1 Part Heat Cure Grades

Properties		XE13-B3208	TSE3212	LA650S	TSE322	TSE322S	TSE3261-G

¹JIS K 6249

Typical property data values should not be used as specifications

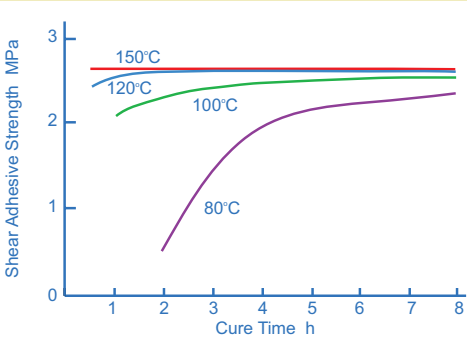

Cure Properties:

The cure performance of 1 Part Heat Cure grades is demonstrated by the relationship between temperature and hardness, and temperature and adhesive strength of TSE322 when placed in an oven at temperatures ranging from 80°C to 150°C.

Hardness & Cure Time - TSE322

Adhesion & Cure Time - TSE322

Storage Stability:

Storage under low temperature conditions is important particularly for 1-part heat cure grades to prevent viscosity increase.

¹JIS K 6249 ²TSE3331K unavailable in Europe and the Americas ³TSE3331K EX unavailable in Asia

Pot Life:

The pot life of a 2 Part Heat Cure grade is affected by changes in viscosity that occur after the components have been mixed.

Cure Properties:

The cure performance of 2 Part Heat Cure grades is demonstrated by the relationship between temperature and hardness of TSE3380 when placed in an oven at temperatures ranging from 100°C to 150°C.

Hardness & Cure Time - TSE3380

Product Details - 1 Part Gels

Properties		TSE3051	TSE3051-FR	TSE3051-L

HWI			HAI			HVTR			D495			CTI		
Resistance to ignition when exposed to high temperatures. Expressed as the mean number of seconds required to ignite a specimen when wrapped with an energized ni-chrome resistive wire that dissipates a specified level of energy.	Mean Ignition Time (sec)	PLC	Ability to withstand electrical arcing. Expressed as the number of arc rupture exposures required to ignite a specimen when the arc occurs directly on the surface or a specified distance above the test specimen.	Mean No. of Arcs	PLC	Expressed as the rate (inches per minute) that a tracking path can be produced on the surface of the material under standardized test conditions.	HVTR Range (in mm/min)	PLC	Expressed as the number of seconds that a material resists the formation of a surface-conducting path when subjected to an intermittently occurring arc of high voltage, low current characteristics.	Arc Resistance (sec)	PLC	Expressed as that voltage which causes tracking after 50 drops of 0.1% ammonium chloride solution have fallen on the material.	Tracking Index (volts)	PLC

Other Electronic Solutions from Momentive Performance Materials

Provides detailed information on silicone materials used for thermal management applications in electronics and micro-electronics. Includes SilCool® grease & adhesives, and conventional grades for adhesion, encapsulation and potting.

Provides opto-electronic solutions for LED Packages and Assemblies. Includes InvisiSil® LED encapsulants, Glob Top, Lens fabrication materials, Die Attach adhesives, and Dot Matrix assembly materials.

Frequently Asked Questions

What does RTV mean?
RTV stands for Room Temperature Vulcanization (cure). Despite the low-temperature connotations conveyed by this name, RTV silicones consist of both Room Temperature Cure and Heat Cure grades.

What is the cure mechanism of a condensation cure product?

Condensation cure silicone products cure when exposed to atmospheric moisture. Moisture in the air is generally required to cure (or vulcanize) condensation cure products. The cure process begins from the outer surface, and therefore time is required for complete cure. The cure time is affected by the reaction mechanism and viscosity of the material. Generally, at 25C and 50%RH, condensation cure RTV silicones cure through in 24 to 48 hours. Full physical properties may take up to 7 days to develop.

What is the depth (bead thickness) limit for a condensation cure grade?

For 1-part, condensation cure products, the depth (bead thickness) limitation is approximately 6mm (1/4"). For 2-part, condensation cure products, the depth (bead thickness) limitation is approximately 25mm (1").

Can I accelerate the cure time of a 1-part product?

Condensation cure silicone cure rates depend on humidity, silicone thickness, and to a smaller degree heat. Increasing the relative humidity around the silicone or reducing the thickness of the material will reduce the time to cure the material. Increased heat (not over 50C) will somewhat reduce cure time but as mentioned will do so to a much smaller degree than humidity or thickness.

What is the cure mechanism of an addition cure product?

Addition cure silicone RTV products may be 1 or 2-part and cure when exposed to

heat. Although some heat cure products can cure at room temperature, higher heat greatly accelerates the cure. 1-part heat cure products typically have an inhibitor in the formulation that stops the product from curing until an activation temperature, greater than room temperature, is achieved and the inhibitor is driven off and the cure reaction is allowed to proceed.

What does "tack free time" mean?

Tack free refers to the amount of time it takes for a condensation cure silicone product to form a cured outer layer (the cured outer layer is not tacky like uncured material).

What is "mix ratio"?

Mix ratio is a term used to state the amount of each material to be in a multi-component material. The mix ratios for 2-part products are described on the individual product data sheets and are given as a ratio by weight of each material.

What does "pot life" or "work life" mean?

The amount of time after a 2-part grade is mixed with its curing agent that it will remain useful or pliable.

How do I remove silicone?

Before it is cured: use a putty knife to remove any of the uncured paste. Wipe the area clean with isopropyl alcohol to remove any leftover residue. After it is cured: First mechanically remove as much of the silicone as you can with either a knife or a razor. A solvent (mineral spirits, toluene, xylene, acetone) can then be used to remove any oily residue or any remaining silicone. It may be necessary to soak the silicone in a solvent overnight to break it down.

Can I thin a silicone?

Silicone can be thinned using a solvent in which the silicone is miscible, generally an aromatic solvent such as toluene or xylene. As always, be sure to follow the producer's instructions when using solvent products and always use in a well-ventilated area. The shrinkage of the silicone and the cure time will increase with the addition of solvent. Alternative

suggestions would include non-reactive fluids or an RTV with a lower viscosity.

What can I do to improve the adhesion of the silicone adhesive to my parts?

The first step to good adhesion is to have clean surfaces for the silicone to bond to. For difficult-to-bond-substrates, Momentive Performance Materials offers a number of primers that can be used to improve and maximize adhesion.

How do I ensure that air is removed from 2-part grades?

If you are hand mixing, air may become added to the material during the mixing process. Vacuum de-airing is most effective in removing air prior to use. Automated mixing equipment that utilizes a static mixer can eliminate the need to de-air prior to dispensing.

On complex high-density electronics, air can sometimes be trapped under components during the potting process. Where this is a concern, potting under vacuum or vacuum de-airing after potting can remove the trapped air. An alternate approach may be to use a grade with a low viscosity and longer potlife and to cure at lower temperatures (if heat-cure grade), allowing entrapped air to escape prior to the cure of the material.

What is cure inhibition, and how do I prevent it?

Cure inhibition is a phenomenon that may be observed in addition-cure grades. These materials use a platinum catalyst to drive the curing reaction. Surfaces containing water, sulphur, nitrogen compounds, organic metal compounds, or phosphate compounds, may inhibit cure.

Cure inhibition is characterized by a gummy or sticky appearance of the silicone at the interface between the silicone and offending substrate. Inhibition can be prevented by application of a barrier coat, cleaning of the offending material prior to application of the silicone material, replacing the offending material with a suitable alternative, or selection of a condensation cure grade.
